

“Grid” Customization Overview

Prior to v9.0, all SafetyNet reports were static, with the ability to filter based on the “Criteria” section. Introduction of the new grid feature will allow unprecedented customization and filtration of report layouts and viewing within SafetyNet. These changes allow our application to provide progressive enhancement that can be applied to this flexible foundation.

Customization

Once a report is filtered using the standard search criteria function, the grid provides the following functionality:

- Click and drag columns
- Sort columns, ascending or descending
- Multi-sorting data (e.g. by project and then by count)
- Add and remove columns and metrics
- Grouping by column and multi-grouping
- Add a formula column, creating a new metric

These features can be accessed directly by interacting with the column or by right-clicking on a column, as seen to the right.
